

What is 'super' keyword?

- The super keyword in Java is a reference variable which is used to refer immediate parent class object.
- Whenever you create the instance of subclass, an instance of parent class is created implicitly which is referred by super reference variable.

Usage of super Keyword

- super can be used to refer immediate parent class instance variable.
- super can be used to invoke immediate parent class method.
- super() can be used to invoke immediate parent class constructor.

'Super' keyword to invoke the constructor

```
class Animal{
    Animal(){
        System.out.println("animal is created");
    }
}
class Dog extends Animal{
    Dog(){
        super();
        System.out.println("dog is created");
    }
}
class Main{
    public static void main(String args[]){
        Dog d=new Dog();
    }
}
//output
//animal is created
//dog is created
```

'Super' keyword to invoke the method

```
class Animal{
    void eat(){
        System.out.println("eating...");
    }
}
class Dog extends Animal{
    void eat(){
        System.out.println("eating bread...");
    }
    void bark(){
        System.out.println("barking...");
    }
    void work(){
        super.eat();
        bark();
    }
}
class Main{
    public static void main(String args[]){
        Dog d=new Dog();
        d.work();
    }
}
```

'Super' keyword to access the instance variable

```
class Animal{
    String color="white";
}
class Dog extends Animal{
    String color="black";
    void printColor(){
        //prints color of Dog class
        System.out.println(color);
        //prints color of Animal class
        System.out.println(super.color);
    }
}
class Main{
    public static void main(String args[]){

        Dog d=new Dog();
        d.printColor();
    }
}
//output
//black
//white
```
